I have made a simple calculator that takes numbers as an input from user and perform arithmetic operations like addition, subtraction, multiplication, division. Below are the steps for using the calculator.

The calculator will ask the user to enter the first number and then second number.

Then it asks to choose which operation we would like to carry out by choosing numbers between 1 to 4 as 1 for addition, 2 for subtraction, 3 for multiplication, 4 for division.

After that it performs the operation which you have chosen.

In the end it asks if you would like to perform another calculation as Yes/No input. If you type Yes, it goes back to first step which is enter first number. If you type No, the program ends with the end message as Goodbye!
